Report Title:  Contaminants in sediment 1986-92 Joint Monitoring Programme (JMP) Norwegian data NIVA samples  (Norwegian State Pollution Monitoring Programme Report no. 599/95. TA-no. 1180/1995)	Date: Printed:  NIVA 1995
Author(s):  Norman W.Green Audun Rønning	Topic group:  Marine contamiant
	Geographical area:  Oslofjord to Lofoten
	Pages: Edition:  97

Client(s):  Norwegian State Pollution Control Authority (SFT)	Client ref.:
---	--------------

Abstract:  The report is a compilation of data used in the Norwegian contribution to the Joint Monitoring Programme and the North Sea Task Force Master Monitoring Plan for monitoring of contaminants (mainly: selected metals, organochlorines, polycyclic aromatic hydrocarbons) in sea bed sediment collected 1986-92. The samples were collected by gravity corers and along the coast from Oslofjord to Lofoten. The raw data and the mean and standard deviation of parallel samples are presented.

## Preface

*This report presents a summary of the Norwegian data for contaminants in sediments 1986-1992 sampled by the Norwegian Institute for Water Research (NIVA) and compiled for the Joint Monitoring Programme (JMP). JMP is administered by the Oslo and Paris Commissions (OSPARCOM) under the guidance of the International Council for the Exploration of the Seas (ICES). The programme is implemented by participating members comprising the Joint Monitoring Group (JMG).*

*The Norwegian JMP was primarily carried out by the NIVA by contract from the Norwegian State Pollution Control Authority (SFT) (NIVA contract 80106). Other participating institutes have been:*

*Institute for Nutrition, Fisheries Directorate  
Institute of Marine Research (IMR)  
Nordic Analytical Center  
Swedish Environmental Research Institute  
Norwegian Veterinary Institute  
Foundation for Scientific and Industrial Research at the Norwegian Institute of Technology - SINTEF (a division thereof, previously: Center for Industrial Research SI)*

*The Norwegian contribution to the JMP was initiated by SFT in 1981 as part of the national monitoring programme. It now comprises three areas: the Oslofjord and adjacent areas (Hvaler-Singlefjord area and Langesundsfjord, 1981-), Sørkjosen Hardangerfjord (1983-84, 1987-) and Orkdalsfjord area (1984-89, 1991).*

*Since the North Sea Task Force Monitoring Master Plan (NSTF-MMP) was implemented in 1990 additional areas have also been monitored. These include: Arendal area, Lista area and Bømla-Sotra area. On the initiative of NIVA and SFT blue mussel and fish were sampled at selected sites in merely diffusely contaminated areas (reference stations) from Bergen to Lofoten in 1991 and 1992.*

*Thanks are due to my colleagues at NIVA and the above mentioned institutes for helping to compile this data. These have been credited through the years in the National Comments. I am especially grateful to Audun Rønningen who has been responsible for the computer programs necessary to create the tables presented in this report.*

*The Norwegian 1990 investigations on sediments for the NSTF-MMP and the JMP were carried out by the Institute of Marine Research (IMR referred to herein as ICES code IMRN) and the Norwegian Institute for Water Research (NIVA) and has been reported separately (Green & Klungsøy, 1994). This investigation was funded by the Department of Fisheries and by the Norwegian State Pollution Control Authority. For the sake of simplicity "NIVA" stations sampled in 1990 are also included in this report.*

*It is with appreciation that the following are recognized for their contribution to this report:*

*NIVA*

- *Collection of samples: Unni Efriamsen, Frank Kjellberg and Roger Konieczny*
- *Metal analyses: Marit Villø and her colleagues*
- *Data entry: Marit Mjelde and Tone Jørn Oredalen*
- *Programming: Audun Rønning and Gunnar Severinsen*

*IMRN*

- *Collection of samples: Kjell Westrheim and Svein Wilhelmsen*
- *Organic analyses: Kjell Westrheim and Svein Wilhelmsen*

*Other institutes*

- *Sediment age determinations: Anders Jensen (FORCE institutes, DK)*
- *Arsenic analyses: Kåre Helge Karstensen (SINTEF-SI, Oslo)*

*Oslo, 31. January 1995.*

*Norman W. Green  
Project coordinator*

# 1. Background and aims

The 1982-92 data for contaminants in sediment was compiled as part of the Norwegian contribution to the Joint Monitoring Programme (JMP) and the North Sea Task Force Monitoring Master Plan (NSTF-MMP) for the years 1990-91.

The JMP is performed as part of the Oslo and Paris Commissions (OSPARCOM). OSPARCOM was established in the seventies with the aim to protect the marine environment against anthropogenic contamination. The Oslo commission focuses on problems relating to dumping at sea in the northeast Atlantic and Baltic areas. Whereas the responsibility of the Paris commission is discharges from land based sources. Together, the commissions govern the "Joint Monitoring Group" (JMG) with the "International Council for the Exploration of the Sea" (ICES) as scientific adviser. Norway and other European countries, which are members of OSPARCOM have the following aims outlined in the "Joint Monitoring Program" (JMP) (OSPARCOM, 1990):

- 1) Assess the state of contamination,
- 2) Indicate possible remedial action.

The NSTF was established in 1989 by the countries bordering the North Sea. The NSTF aim is (NSTF, 1990):

*To carry out work leading, in a reasonable time-scale, to a dependable and comprehensive statement of circulation patterns, inputs and dispersion of contaminants, ecological conditions and effects of human activities in the North Sea.."*

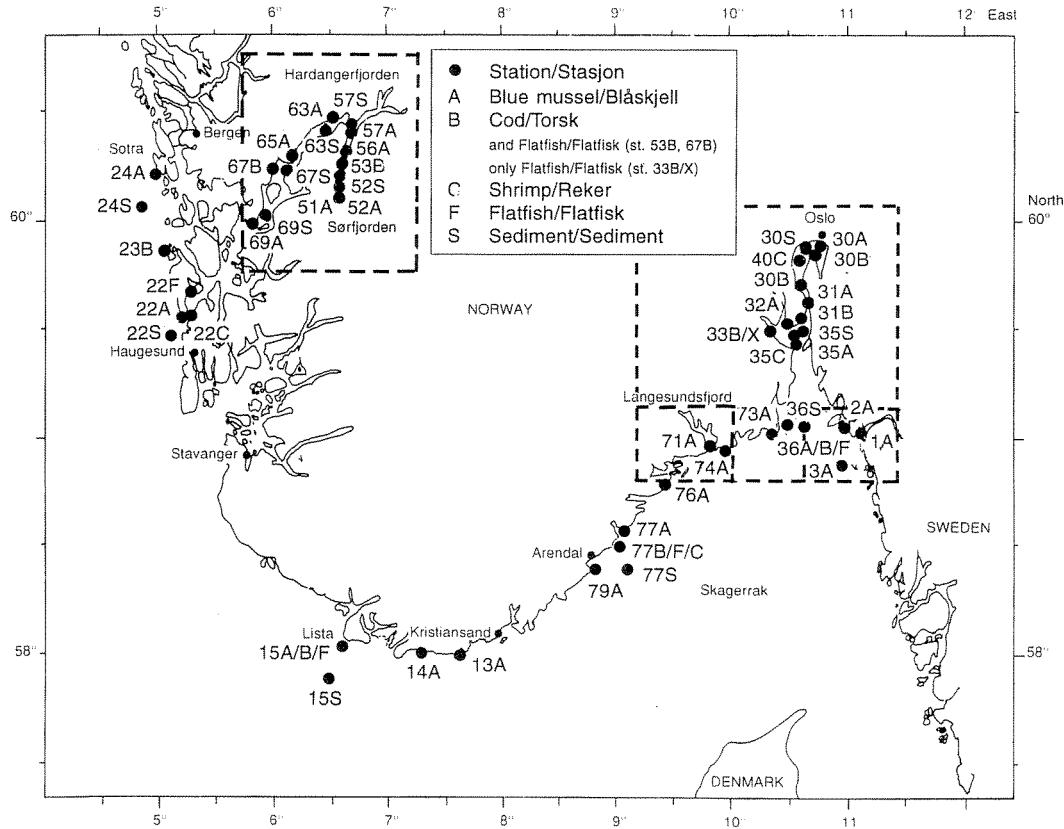

Norway has designated three JMP areas: Oslofjord-area (including the Hvaler area, Singlefjord and Langesundsfjord), Sørfjord/Hardangerfjord and the Orkdalsfjord area and during 1990-92 have also included Arendal and Lista and selected stretches of coastline between Bergen and Lofoten (Fig.1 - 3). The sediment results have been presented for 1986 (Green, 1987) and 1990 (Green & Klungsøy, 1994).

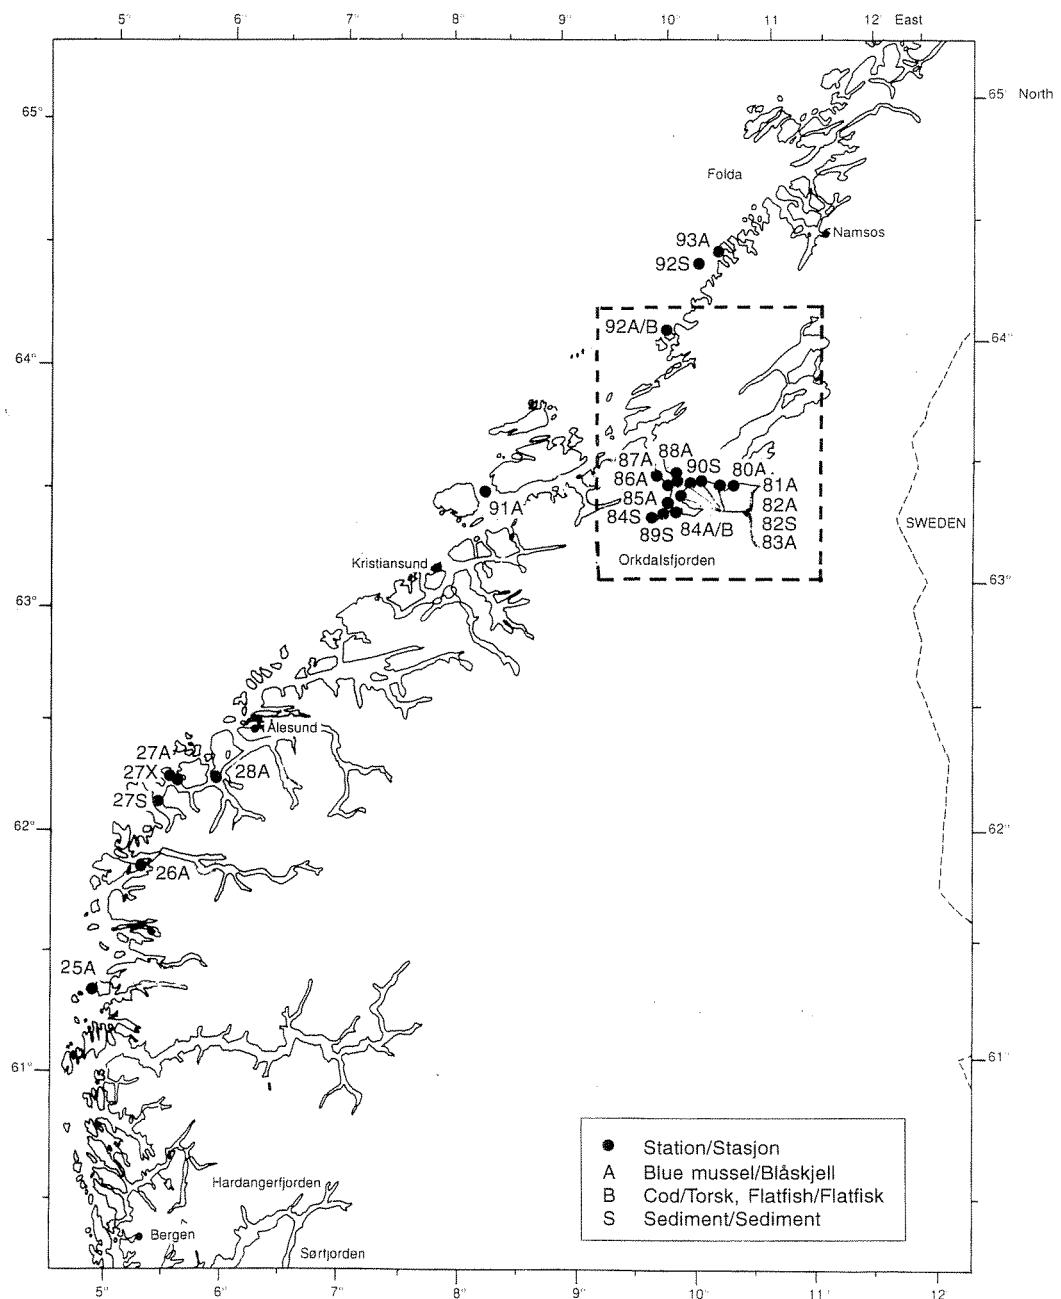

## **2. Sampling**

The JMP sediment stations monitored in 1986-92 by Norway are spread from the Oslofjord to Lofoten (Fig.1 - 3).

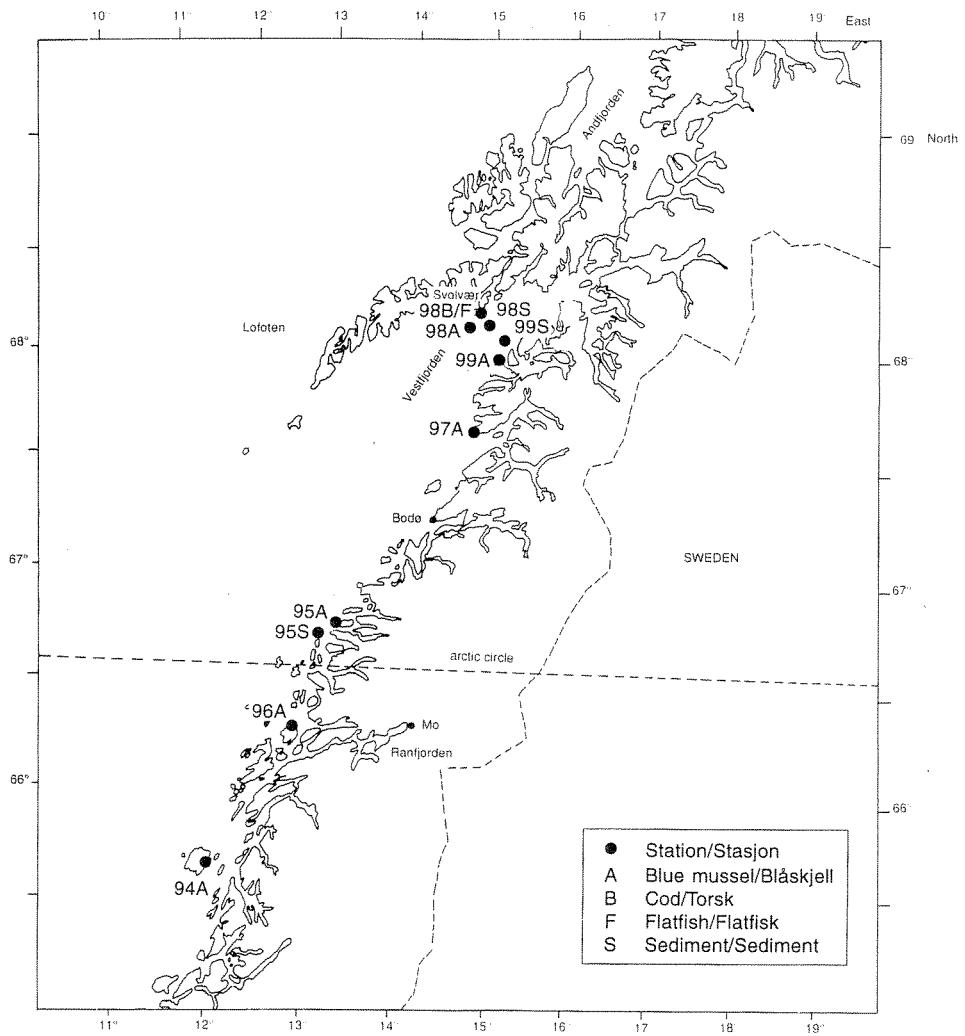

The sampling of sediment has followed the ICES guidelines (ICES 1986, 1992) as closely as possible. Sampling is done with a gravity corer. The cores were sliced, each slice was 1cm thick, less frequently 2 and 5cm. Parallel cores were taken at each station.

All analyses were carried out by NIVA except for analyses of PCB and PAH in 1990 which were carried out by Institute for Marine Research in Bergen and core dating which was analyzed by Water Quality Institute (previously part of FORCE institutes) in Denmark.

**Figur 2.** JMP sampling stations along the western coast of Norway from Bergen to Namsos.

**Figur 3.** JMP sampling stations along the northwest coast of Norway from the region of Ranfjord to Lofoten.

### 3. Analyses

JMG (OSPARCOM 1990) agreed that the concentration of at least cadmium, copper, mercury, lead, zinc and polychlorinated hydrocarbons should be monitored in biota. In these investigations many other contaminants have also been quantified. A complete list of variables used is given in section 4. An overview of the contaminants and associated analytical methods has been given by Green (1993).

Recently JMG has preferred that **seven individual isomers of PCB** be quantified (Table 1) which provided a far better basis for assessing trends and gradients of PCB; besides easing comparison of the results from one country to another. In addition, it was favourable and practical to quantify **SumDDE+DDT**, **HCB**, and the remaining **HCH-isomers** in connection with the analysis of chlorinated compounds. In some cases (analyses at NIVA) it was also convenient to include determinations of pentachlorbenzene(**5-CB**), octachlorstyrene (**OCS**), **CB-156** (2 3 4 5- 3'4'), **CB-209** (2 3 4 5 6 - 2'3'4'5'6) and **CB-105** (2 3 4 - 3'4').

**Tabell 1.** Suggested PCB-isomers which were quantified in sediment (ICES, 1986).

IUPAC/CB no.	Structure
<b>28</b>	2 4 - 4'
<b>52</b>	2 5 - 2'5'
<b>101</b>	2 4 5 - 2'5'
<b>118</b>	2 4 5 - 3'4'
<b>138</b>	2 3 4 - 2'4'5
<b>153</b>	2 4 5 - 2'4'5'
<b>180</b>	2 3 4 5 - 2'4'5'

## 4. Variables

List of determinands in the Norwegian JMP database (Green, 1993). Codes are derived by ICES (1992). Only a selection of codes are used in Annexes A - B

Abbreviation <sup>1</sup>	English	Norwegian
<b>ELEMENTS</b>

- <sup>1)</sup> After: ICES Environmental Data Reporting Formats. International Council for the Exploration of the Sea. January 1992.
- <sup>2)</sup> Indicates "PAH" compounds that are dicyclic and not truly PAH's typically identified during the analyses of PAH, include naphthalenes and "biphenyls".
- <sup>3)</sup> Indicates PAH compounds potentially cancerogenic for humans according to IARC (1987), i.e., categories 2A+2B (possibly and probably carcinogenic).
- \* The Pesticide Index, second edition. The Royal Society of Chemistry, 1991.

## 5. Analytical laboratories

The analytical laboratories involved in the 1986-92 sediment survey are listed below (ICES laboratory codes) (from Green, 1993):

Abbreviation <sup>1</sup>	English	Norwegian
<b>INSTITUTES</b>		
<b>FORC</b>	Water Quality Institute (earlier a part of FORCE Institutes, Div. for Isotope Technique and Analysis) [DK]	<i>Vannkvalitets instituttet (tidligere en del av FORCE Institutterne, Div. for Isotopteknik og Analyse) [DK]</i>
<b>IMRN</b>	Institute of Marine Research (IMR)	<i>Hayforskningsinstituttet</i>
<b>NIVA</b>	Norwegian Institute for Water Research	<i>Norsk institutt for vannforskning</i>
<b>SIIIF</b>	Fondation for Scientific and Industrial Research at the Norwegian Institute of Technology - SINTEF (a division, previously: Center for Industrial Research SI)	<i>Stiftelsen for industriell og teknisk forskning ved Norges tekniske høgskole-SINTEF (en avdeling, tidligere: Senter for industriforskning SI</i>

<sup>1)</sup> After: ICES Environmental Data Reporting Formats. International Council for the Exploration of the Sea. January 1992.

## 6. Analyses code descriptions

Brief descriptions of the analytical methods employed for JMP and NSTF-MMP have been coded and compiled (Green, 1993). With the exception of arsenic, those relevant to the 1990 sediment survey are listed below. Arsenic determinations were done by SII in 1993 using atomic absorption using hydride technique on an aliquot from NIVA HF extract (cf., code 351)

The following descriptions (excerpts from Green 1993) focus on the principles involved and hence are not intended as detailed specifications. The descriptions may vary arbitrarily in detail and are coupled to period analysis for the 1990 sample and hence, may not necessarily reflect methods currently practiced by the contributing institutes. Note also that the descriptions do not necessarily list which specific compounds of PAH's and PCB's are determined. These can be derived from Annex A.

<i>code</i>	<i>description</i>
-------------	--------------------

**350      Mercury in sea bed sediment (NIVA)**

Drying procedure

An accurately weighed sample of approximately 1g is dried at 105°C for one hour. The sample is cooled in a desiccator for one hour before weighing. Normally, determinations are on wet samples and the water content is determined of a subsample.

Extraction (oxidation)

Approximately 1g of the sample is accurately weighed in pyrex flasks, 20ml 7N (concentrated) nitric acid (suprapur) is added and the solution heated 120°C for 30min in an autoclave. The solution is transferred to a 100ml volumetric flask and diluted to the mark with deionized water.

Determination

A maximum of 100ml sample used, diluted if Hg >50ng/l; P-E 1100 B with gold trap used, helium replaced air as carrier gas and lowest signal was 2.5ng/l.

**351      Chromium, copper, iron, manganese, nikkel and zinc in sea bed sediment (NIVA)**

Same procedure as 350: #1, Drying.

Extraction (oxidation)

'Total' extraction (HFO): Approximately 0.1g of the sample is accurately weighed in, 2ml of hydroflouric acid and 2+2ml of concentrated nitric acid ('aqua regia') is added and the solution heated in a microwave oven. The solution is transferred to a 100ml volumetric clask and diluted to the marked with deionized water.

Determination

Determinations by **flame atomic absorption spectrometry** using acetylene/air flame. Instrument: *Prior to 1986* a Perkin Elmer model 2380 was used and *since 1986* the P-E

560 has been used. For determinations of low concentrations (below detection limits) the flameless method (352) is used. The following are elements often analyzed by flame and their respective detection limits of extract solution:

Element		µg/l
Al	aluminium	1000
Cr	chromium	50
Cu	copper	100
Fe	iron	200
Li	lithium	10
Mn	manganese	50
Ni	nickel	100
Zn	zinc	10

- 352      **Aluminium, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, nickel, and zinc in seabed sediment (NIVA)**

Same procedure as 350: #1, Drying.

#### Extraction (oxidation)

'Total' extraction (HFO): Approximately 0.1g of the sample is accurately weighed in, 2ml of hydrofluoric acid and 2+2ml of concentrated nitric acid (suprapur) is added and the solution heated in a microwave oven. The solution is transferred to a 100ml volumetric flask and diluted to the mark with deionized water.

#### Determination

Concentrations are determined by **graphite furnace atomic absorption** electrothermal spectrometry or GFAAS using a hollow cathode lamp (HCL) or an electrodeless discharge lamp (EDL) as a light source. *Prior to 1986* a Perkin-Elmer model 560 with HGA-500 graphite furnace was used and *since 1986* the P-E 2380 has been used instead of the P-E 560.

A 20µl portion of extract, treated with HNO<sub>3</sub>, is injected into graphite tube. The sample is then heated electrothermally in a stepwise manner through drying, ashing and atomization by a programme designed for each element. The programme which controls the ramp time, holding time and temperature for each phase is often adjusted to achieve optimal results.

The elements analyzed and approximated limit of detection for the extract are:

Element		µg/l
Al	aluminium	5
Cd	cadmium	0.1
Co	cobalt	5
Cr	chromium	0.5
Cu	copper	0.5
Fe	iron	5
Li	lithium	10
Mn	manganese	0.5
Ni	nickel	5
Pb	lead	0.5
Zn	zinc	10

#### 650 Pb-210 dating (FORC)

reference: Pheiffer Madsen, P., Sørensen, J., 1979. Validation of the Lead-210 dating method. Journal of Radioanalysis and Chemistry 54:39-48.

Excerpt (Larsen, B., & Jensen, A., 1989. Marine Pollution Bulletin 20(11):556-560.): "The determination of time- dependent sediment parameters is based on the vertical distribution of the natural radioactive isotope lead-210 [=  $^{210}\text{Pb}$ ] ... The content of unsupported lead-210, that lead-210 not produced in the sediment) decreases regularly downwards in undisturbed and steadily deposited sediment owing to radioactive decay. Departures from this predictable lead-210 profile in the topmost sediment column permit an assessment of mixing and/or intermittent erosion."

Dried slices of sediment are employed.

#### 760 PCB in sea bed sediment (IMRN)

PCB in total sediment (50g) were extracted by acetone and hexane:Acetone (3:1) using repeated ultrasonication and agitation (Jensen et al., 1977).

Sulphur was removed with metallic mercury.

A florisil column (100-230 mesh, 30 cm x 6 mm ID) was used for the separation of the extract into 3 fractions. The first fraction eluted with 2 ml pentane was discarded; the second fraction eluted with 6.5 ml pentane contained PCB, HCB, aldrin, o,p-DDE, p,p-DDE and o,p-DDT; and the third fraction eluted with 10ml pentane:acetone (9:1) contained, alpha-HCH, beta-HCH, gamma-HCH (Lindane), o,p-DDD, p,p-DDD, o,p-DDT (20%) and p,p-DDT.

The third fraction needed further clean up on a neutral alumina column (30 cm x 6 mm ID; deactivated with 6% water). The chlorinated pesticides were eluted with 18 ml pentane. Beta-HCH was not eluted using this method.

A few samples (1990 sediment stations 15S-67S) were cleaned up before separation on the florisil column. A short silica column (10 cm x 6 mm ID) was used, followed by a

alumina column (10 cm x 6 mm ID, acidic Al<sub>2</sub>O<sub>3</sub>). Pentane:dichloromethane (4:1) was used for elution of the compounds.

The chlorinated compounds were quantified on GC (ECD) using two different columns: SE-54 CB, fused silica, 50 m x 0.20 mm, 0.11 µm; SP-2330, fused silica, 60 m x 0.25 mm, 0.20 µm.

Reference: Jensen, S., Renberg, L., Reutergårdh, L., 1977. Residue analysis of sediment and sewage sludge for organochlorines in the presence of elemental sulfur. Anal. Chem. 49:316-318.

**769 PAH in sea bed sediment (IMRN)**

Ca.50 g of total sediment (< 2mm) were extracted three times with acetone and hexane:acetone (3:1) using ultrasonication and agitation.

The clean-up of the extract was carried out on a short silica column (10 cm x 6 mm ID) using pentane:dichloromethane (9:1) as eluent. GC/MS equipped with a SE-54 fused silica capillary column (50 m x 0.20 mm ID, 0.11 µm film thickness) was used for the analysis of 2-6 ring aromatic hydrocarbons.

**390 Total organic nitrogen and organic carbon (CORG) in sea bed sediment (NIVA)**

5-8mg of freeze dried sample is weighed in a tin-foiled capsule and heated to over 1800 °C in an oven. The carbon in the gas is analyzed in a C-N 11O6 Carlo-Erba element analyzer. Detection limit for C is 1 µg/mg and N is 1 µg/mg.

## **7. Comment on quality assurance and detection limit**

The analytical labs have been routinely involved in international and national intercalibration exercises. An overview of which exercises the laboratories have participated in has been given in Green (1995). In addition the laboratories have (more regularly in recent years) analyzed standard reference material in connection with analyses of the samples used in monitoring. The results of incalibration excercises and analyses of the standard reference material is discussed in part in the annual National Comments.

The detections limits are approximations based on 3 times the standard deviation of the 'blank' or near zero concentration of a solution. Day-to-day variations in the analytical instrument may lead to minor variation in detection limits.

## **8. Explanation of Annexes A and B**

Annex A present the raw data from the 1986-92 sediment investigations. Annex B presents the count, mean and standard deviation for parallel samples, if relevant. All data is on a **dry weight** basis. Three units of measure are used: **ppt** (parts per thousand), **ppm** (parts per million) and **ppb** (parts per billion). The numeric values shown have been printed with a fixed number of digits and do not necessarily indicate analytical precision.

The table headings are mostly self explanatory but the following may be helpful:

<b>Sample area</b>	refers to the official JMP designation and for the most part this is undefined (designated J99). The stations are sorted beginning with those in Oslofjord and continuing around the coast to Lofoten.
<b>Locality</b>	station name and position.
<b>Type</b>	refers to sample method: where GC = gravity corer (used by NIVA).
<b>Diameter</b>	refer to the inner diameter (mm) of GC.

The abbreviations for analytical laboratory, analysis code, detection limit and variable name have been explained in the preceeding sections

The order of NIVA stations in the tables are as follows (see also Fig.1 - 3):

30S, 35S, 36S, 77S, 15S, 22S, 24S, 52S, 56S, 57S, 63S, 67S, 69S, 27S, 89S, 84S, 82S, 90S, 92S, 95S, 99S, 98S

☞ NB ! The numeric values shown have been printed with a FIXED number of digits, and do not necessarily indicate analytical precision.

☞ For " $\Sigma$ " variables (e.g. CB\_ $\Sigma$ 7, DD\_ $\Sigma\Sigma$ ) , all the "<"-values (less than the detection limits) are counted only once. If two or more different "<"-values are present, the maximum of the least questionable (suspect) "<"-value is used. Any missing " $\Sigma$ "-elements are ignored.

☞ Footnotes consist of 4 parts:  
1: a letter code (e.g ? or s)  
   The letter code may include one or more characters indicating possible matching letters referenced before or after numbers.  
2: a count (in parenthesis)  
3: a "!" or ">"  
   "!" refer to notes BEFORE numeric values.  
   ">" refer to notes AFTER numeric values.  
4: The footnote explanation.

# **Annex B**

## **Sediment 1986-92**

### **Parallel mean and standard deviation**

08/02-95

**REPORT INFORMATION : " S E D I M E N T ".**

----- : -----  
**Table-File-Name** : I:\TBX\JMG\SED\TAB-1SED.TB1  
**Limit-CheckFile** : )LIM\NI941013.SED  
**Weight basis** : "DRY.weight".  
**Table SORT-Mode** : 1. LOCALITY-index  
                  1.1: Sampling Lab = NIVA  
                  (Predefined sequence)  
                  1.2: OTHER Sampling Labs  
                  (Position North:South,  
                  and West:East)  
                  : 2. Sample DATE.  
                  : 3. Tables may be separated into  
                  to "variable-groupes" tested  
                  as: Subno = 0 and Subno > 0

----- : -----

**NOTES :**

- ☞ NB ! The numeric values shown have been printed with a FIXED number of digits, and do not necessarily indicate analytical precision.
- ☞ For " $\Sigma$ " variables (e.g. CB\_Σ7, DD\_ΣΣ) , all the "<"-values (less than the detection limits) are counted only once. If two or more different "<"-values are present, the maximum of the least questionable (suspect) "<"-value is used. Any missing " $\Sigma$ "-elements are ignored.
- ☞ If value is prefixed "<<", the number of "<" values is greater or equal to 25% of computed observations. Standard Deviation values are prefixed the character "~" if any "<" values are included.
- ☞ Footnotes consist of 4 parts:
  - 1: a letter code (e.g ? or s)  
The letter code may include one or more characters indicating possible matching letters referenced before or after numbers.
  - 2: a count (in parenthesis)
  - 3: a "!" or ">"  
"!" refer to notes BEFORE numeric values.  
">" refer to notes AFTER numeric values.
  - 4: The footnote explanation.

Sample-area: J26 Oslofjorden. All concentrations on Dry-weight basis.  
 Locality : 30S Steilene, Latitude: 59°49'10N, Longitude: 10°33'80E  
 Sample date: 861029 , Sampling Lab: NIVA, Type: GC, Diameter: 050  
 Est. sedimentation rate mm/year. Unfractionated sample unless "!!" then <63µm.
